2015

Improv theatre

Engineering leader with 6+ years at Trusk, a last-mile logistics scale-up: backend engineer, then squad Team Lead, now Tech Architect leading the 5-engineer Core team. I own delivery, process and hiring, partner with Product on the roadmap, and stay hands-on in architecture and code reviews. I moved my team to spec-driven, agent-executed delivery (IAM overhaul: 250+ PRs, 42 repos, zero auth incidents). Before Trusk, co-founded a B2B telephony start-up and built its product from scratch.

Trusk **Paris**
Tech Architect **02/2025 – Present**

- Lead the Core team: 5 engineers (2 senior, 2 mid-level, 1 junior) within a ~19-person tech team, partnering daily with Product on roadmap and scope; run rituals and retros, and hire
- Shaped the tech organisation: contributed to the R&D reorganisation into feature teams (each with a PM and tech lead), created a third feature team around a lead I selected, kept a squad intact through the CTO's departure, and presented the 2027 tech strategy pillar
- Led delivery of the new central back-office within a year, replacing several legacy tools and frontends (order search time cut from 90 s to ~1 s)
- Led the IAM authorization overhaul: 250+ PRs across 42 repositories, largely executed by AI coding agents from a written spec; 300+ API routes secured and 11 production services cut over with zero auth incidents
- Mapped the full system landscape (~50 micro-services, 4 domains) and drove its decommissioning: 11 legacy services retired in Oct 2025, 15 more through the 2026 migrations
- Architecture I steer: 500+ REST endpoints on 26 NestJS services, RabbitMQ across 38 services, a PostgreSQL schema per service, Redis, S3; Kubernetes, ArgoCD, Terraform
- Specified and drove two core engines: the generic State/Status engine (6 architectures compared, up to Temporal workflows; V2 shipped Oct 2025) and PDT26, the transport-plan engine replacing the legacy calendar (73 design decisions, Wissous site pilot)
- Drove the data-model redesign (Order → OrderMission → Mission) and the migration off the legacy TruskAPI monolith
- Designed the consolidation of 4 overlapping systems (monolith, dispatcher, mobile gateway, sourcing) into a single Fleet service, cut over in two batches (first batch live Oct 2025)
- Contributed to the database consolidation: per-service schema proof of concept; uncovered a 75 GB legacy instance still serving 13 production services
- AI-native delivery: agent-driven migrations, Claude Code plugins, MCP tooling

Team Lead – Order Taking squad **05/2022 – 11/2025**

- Managed the Order Taking squad (4 developers, reporting to the CTO), owning B2B order intake and client integrations, and the squad roadmap with the Product Manager
- Shipped 20+ retail client integrations (e.g. ManoMano, Alinéa, Poltronesofa, Vente Unique, Emma) and standardised the integration process
- Redesigned the dev & release process across 60+ services: GitHub Actions shared workflows, semantic-release, Renovate, Terraform-managed permissions, moved the team to Linear; CI costs cut ~10× and release preparation from 2–3 h of team-lead time to under 1 h
- Led “Maillage National” (Oct 2023 – Mar 2025), the expansion of Trusk's coverage across France through a network of regional carriers
- Ran 1:1s and onboarding (developer onboarding scripts); authored and facilitated the EMMA client-launch post-mortem

Backend Developer **02/2020 – 05/2022**

- Main developer of the B2B pricing engine: per-client price grids for ~10 retail accounts (IKEA, Norauto, Conforama, Alinéa, Fermob…), weight and vehicle rules
- Main backend developer of the driver-app API (alpha 2 → 6); built the push-notification and SMS-template services from the first commit; designed the warehouse stock API v2
- Made EDI order intake generic; top committer as it reached 13 retail integrations
- Ran cross-service platform migrations: 161 PRs across 22 services (container builds to Google Container Registry, shared CI configs, Datadog tracing); moved 9 services onto the shared RabbitMQ module with AsyncAPI docs
- Grew into the lead role: release manager, sprint prep, more reviews than own PRs

Gaston **Paris**

Co-founder **2018 – 2020**

- Co-founded and ran a B2B telephony start-up, building the product from scratch: from the first line of code to a launched product
- Built the web and cross-platform apps (React, Redux, React Native) and the Node.js / Express / MongoDB API
- Designed the real-time backend handling a high volume of phone calls on Twilio
- Set up delivery from zero: continuous integration, containerised (Docker) and serverless deployments on GCP
- Named “App of the week” by Maddyness; featured on Europe 1 radio

Freelance **Paris**

Software Engineer & Consultant **2016 – 2020**

- Innovation consultant at Schoolab (Lean Factory): built educational prevention mini-games
- Migrated a professional intranet and accounting back-office; built chatbots, crawlers and websites
